

ROBOT DRAWING PLAN

PROCESS NOTES / PROGRAMMING PLAN

[illegible]

FLOW / TESTING / VERSION CONTROL PLAN

TEST CHECKLIST

- ☐ Left / Right arrows move X
- ☐ Up / Down arrows move Y
- ☐ Left mouse makes robot follow cursor
- ☐ Space makes body green
- ☐ Right mouse makes body red
- ☐ Robot stays inside window
- ☐ All body parts move together

GIT COMMITS / PROCESS NOTES

POSSIBLE GIT COMMITS

1. Create 2D Game Template project

Set up the GAME 10033 project and make sure it builds and runs.

2. Draw basic robot shapes

Add the head, body, eyes, antenna, arms, hands, legs, and feet.

3. Add keyboard movement

Use arrow-key input to change robotX and robotY.

4. Add mouse interaction

Use the left mouse button and mouse X/Y position to move the robot.

5. Add colour interaction

Use Space for green, right mouse for red, and blue as the default.

6. Add movement limits and clean up

Keep the robot inside the window, improve comments, and final-test controls.

PROCESS WORK NOTES

Measurements / coordinates to check

- Robot starts near the centre of the window.
- Head and body use offsets from robotX / robotY so every part moves together.
- Check the left, right, top, and bottom limits using the robot's full size.

Possible corrections while testing

- If Up moves the wrong way, remember that smaller Y values move upward.
- If the robot clips off-screen, increase the boundary distance from the edge.
- If mouse movement places the robot too close to an edge, use the same limits after mouse input.

Test plan

- Arrow keys: confirm left/right change X and up/down change Y.
- Left mouse: confirm the robot follows the cursor while the button is held.
- Space: confirm the body changes to green.
- Right mouse: confirm the body changes to red.
- Move to every edge: confirm the entire robot stays visible.

Why each interaction was chosen

- Arrow keys give simple four-direction movement.
- Mouse control gives direct position input using X and Y.
- Space and right mouse visibly show that different inputs are being read.
